Dose-response across 14 traits and 4 Mimulus population groups

radius = Time Of Experiment (center = TOE 0, edge = 747 h); angle = trait, grouped into one 90-degree quadrant per population group (collection site x collection year), trait names labeled at each wedge's outer edge. Red stars: FDR < 0.05 within that trait x group.
Stress dose = 100 - % of optimal watering, so a larger dose is a drier pot. Dashed ring: Exp 20243 (inner, 0-408 h) and Exp 20244 (outer, 411-747 h) are separate plant cohorts, so the two halves of each wedge are not the same plants followed over time.
