Dose-response across 14 traits and 11 Mimulus maternal lines

radius = Time Of Experiment (center = TOE 0, edge = 747 h); angle = trait. Each quadrant is one population group (collection site x collection year) and is divided into its maternal lines; the 14 traits run in the same order inside every line's wedge, named on the first wedge of each quadrant. Red stars: FDR < 0.05 within that trait x line. Stress dose = 100 - % of optimal watering. Oregon 2014 has two lines, so its third wedge is blank. Dashed ring at 409.5 h: Exp 20243 (inner) and Exp 20244 (outer) are separate plant cohorts. n is only about 20 plants per line per timepoint.
